

Silver Mound Artemisia (*Artemisia schmidtiana* ‘Silver Mound’)

This attractive plant is useful as a spreading border for the flower bed, when used as edging in the perennial garden and growing along paths and walkways. The delicate foliage retains its shape and color during the hottest months of summer.

Often called silver mound wormwood, this cultivar is a relatively small plant. Scattered among tall, flowering summer blooms, the silver mound plant serves as a long lasting ground cover, shading out growing weeds and further reducing silver mound care.

Plant Care / Watering: The silver mound Artemisia is a small, resilient plant, resistant to deer, rabbits and many pests, making it an excellent addition for outlying rock gardens or beds near wooded or natural areas. Silver mound Artemisia care, other than division every two to three years, consists of infrequent watering during periods of no rain and a mid-summer trim, usually around the time the insignificant flowers appear in late June. Trimming keeps the plant tidy and helps it maintain its mounding shape and avoid splitting.
